* Bubble sort :-

* What is bubble sort?

→ it is a sorting Algorithm in which array is will sorted through this Algorithm.

Example: →

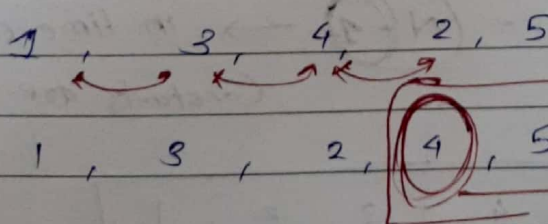

In this algorithm, In array we make comparisons between adjacent elements. if element is smaller than previous one just "Swap it".

We have to make Comparisons till the last one.

* Why bubble sort?

→ With the first pass through the array, the largest element come to the end.

Now 2nd pass ⇒

With the pass no. 2nd largest element is at the 2nd last. in index.

1, 2, 3, 4, 5 ⇒ This is Sorted Array.

* imp } ⇒ Bubble sort Also called as Sinking sort / Exchange sort.

★ Space Complexity:- $O(1)$ // constant
i.e. no extra space required
Aka inplane copying the array etc. not
Sorting Algorithms required.

★ Time Complexity:-

① Best case: $O(N) \Rightarrow$ Sorted.

② Worst case: $O(N^2) \Rightarrow$ Sorted in opposite.
Where N is no. of comparisons.

★ As the size of the Array is growing, no. of Comparisons also growing.

★ Best case \Rightarrow $\underbrace{1, 2, 3, 4, 5}_{i=0 \text{ } j \text{ } j \text{ } j \text{ } j}$ once.
 i th pass

NOTE:- When j never swaps for a value of i means array is sorted.

Best case Comparison = $(N+1)$ \rightarrow in time complexity
Constants are ignored.

★ Worst Case:- $\boxed{5, 4, 3, 2, 1}$
This is worst case!

$$\begin{aligned}\text{Total Comparisons} &= (N-1) + (N-2) + (N-3) + (N-4) \\ &= 4N - (1+2+3+4) \\ &= 4N - \left(\frac{N \cdot (N+1)}{2} \right)\end{aligned}$$

$$= 4N - \left(\frac{N * (N+1)}{2} \right) \Rightarrow (1+2+3+4) =$$

$$= 4N - \left(\frac{N^2 + N}{2} \right)$$

$$= \frac{8N - N^2 + N}{2}$$

$$= 0 \left(\frac{4N - N^2}{2} \right) \Rightarrow \boxed{O(N^2)}$$

$$= \frac{4 \times (4+1)}{2} = \frac{4 \times 5}{2}$$

$$= \frac{20}{2} = \underline{10}$$

Why., Constants are ignored in time Complexity ~~lectures~~.

* Stability :-

in original array black ball of 10 is before red ball of 10, And in the sorted one, this order is maintained.

10, 10, 20, 20, 30

Unstable.
